

A large red square with a white border, centered on a white background. Inside the square, the text "Mayoral Campaign Site" is written in a white serif font.

Mayoral Campaign Site

Project Overview:

I collaborated directly with a mayoral candidate to design and build a static campaign website that reflects their values, priorities, and message. The goal of this website was to give the candidate a digital presence that reflects their vision and goals for the future of their town.

Role: Lead Developer

Key Features:

Campaign Advertising/Merch Order form

Custom contact forms

Technologies Used:

HTML, CSS, Web3Forms

Purpose & Context

This was a personal project I built, per the recommendation of my web development course at CareerFoundry, to further practice my recently gained skills and knowledge.

Objective:

- To create a personal project, outside of the curriculum and guidance of CareerFoundry, that I could add to my professional portfolio
- Problem to be solved:
 - To collaborate with client and build a static campaign site to provide the with an online presence that allows their potential constituents to learn more about the candidate and their campaign

Duration:

The timeline of this project was based on the mayoral campaign timeline, which requested a live site from May through November of 2025. Throughout the month of April, the candidate and I collaborated on the design and layout of the site to ensure that the site was able to be live by May.

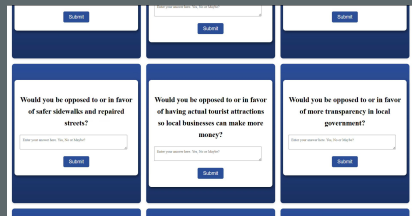

STEPS

The approach started with gathering information from the candidate, regarding their wants and needs for site, like key features and color scheme. With the general idea of how the candidate wanted their site to look, I built a mockup of their website utilizing generic HTML, CSS, and lorem ipsum dummy text with the features and theme they requested and provided it to the candidate for further critiquing.

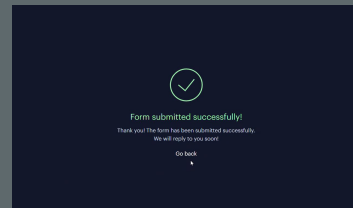

Once the candidate and I had completed the mockup design for the site, the candidate provided me with real text and pictures they wanted displayed on their site. With this information, I replaced the lorem ipsum text and mock pictures with the real content.

One of the features I created, per the request of the candidate, was a section on the website that allows the potential constituents to respond to polling questions posed by the candidate. I utilized Web3Forms contact form API service to create this feature and streamline the process.

The final feature I implemented was an additional contact form, customized to allow potential constituents to request supportive shirts or signs. I was also able to customize the same Web3Forms service to create this feature. Finally, I hosted the mayoral campaign website on Netlify.

FINAL THOUGHTS

Takeaways & App Improvements:	What didn't go well?	What went well?
One of the improvements I would like to make to the website is adjusting the design to look more modern, like adding more touch/click based features or allowing for the website to be compatible with viewing on a mobile device.	The most difficult challenge I experienced with this project was the timeline. Compared to the other projects I completed throughout my CareerFoundry course, the timeline for completion on this project was shorter. In order to compensate for having such a short amount of available coding/research time, rather than creating the necessary features manually, I utilized the Web3Forms contact form API service to streamline the process of getting the website live and hosted.	The mayoral campaign site was the first project that I collaborated on creatively with another person. Considering the collaboration factor and the required shortened timeline for the project, I believe this project rounds out my professional portfolio by displaying I can efficiently and effectively collaborate with a client on a project.
